

Ants of Chindo Island in Korea (Hymenoptera, Formicidae)

Byung-Jin Kim, Ki-Gyong Kim, Dong-Pyo Ryu and Joong-Hyon Kim

(Department of Molecular Biology, Wonkwang University, Iri, Jeonbug 570-749, Korea)

ABSTRACT

The ants found in Chindo Island were investigated from July to October, 1994. We were interested in the ant fauna of this island because it is one of larger islands of Korea and being well supplied with subterranean water, quite different from other islands in this respect. Collections were examined from 11 sites of Chindo Is., of which 21 species of 15 genera under 4 subfamilies are classified and reported.

Key words: Ants, Formicidae, Systematic, Chindo Island, Korea

INTRODUCTION

Chindo Island is located in the South Sea, about 40 km from the administration unit of Haenam. It is a relatively large island with 7 mountains and 13 streams. These supply adequate water for plants and animals. In 1994, most islands experienced water shortages, but Chindo island is quite different from others in water supply. No taxonomic studies of ants have been done in this area to date, hence the ants found on Chindo Is. were investigated from July to October, 1994. We tried to cover as many collecting sites as we could reach in order to obviate bias resulting from small sample size.

Eleven sites were surveyed, approximately 250 ant nests were excavated and collections were moved to the laboratory during the research period. All collections were examined using the stereomicroscope and compared with voucher specimens from Natural History Museum, Great Britain. As taxonomic keys were made following the system of Collingwood (1979). As a result, 21 species of 15 genera under 4 subfamilies were identified. We thank Jack D. Large of the Department of English Education, Wonkwang University for proofreading the English of the final draft.

MATERIALS AND METHODS

About 15,000 ant specimens from 250 ant nests excavated in 11 collecting sites were moved to laboratory. Whenever ant nests were found, they were excavated by spade and ants were collected by aspirator. Initially being preserved in Bouin's solution (80% ethanol 150 ml, formaldehyde 15 ml, picric acid 1 g), for 2 or 3 days later they were moved to 95% ethanol. Specimen was identified by comparison with voucher specimens from Drs. Elmes and Collingwood in England, Rigato in Italy, Onoyama in Japan, and Mr. Wang in China. Taxonomic system follows Collingwood (1979), as does the terminology. Keys of subfamily and genera for the ants of this area were made for the assemblage of all.

SYSTEMATIC ACCOUNT

Key to Subfamilies of Formicidae

1. Pedicel with one nodal segment 2
- Pedicel with two nodal segments Myrmicinae
2. Gaster clearly constricted between first and second segments: final abdominal segment with strong sting Ponerinae
- Gaster without constriction between first and second segment: sting absent 3
3. Cloacal orifice is transverse slit and four abdominal segments are seen from above Dolichoderinae
- Cloacal orifice is seen circular with hairs and five abdominal segments are seen from above Formicinae

Subfamily Ponerinae Lepeletier 침개미아과

Key to genera of Ponerinae

1. Mesopleura with slopely running groove *Ectomomyrmex*
- Mesopleura flat without groove and in profile pronotum and mesonotum convex *Brachyponera*

Genus 1. *Brachyponera* Emery, 1901 왕침개미속

Brachyponera Emery, 1901, p. 43.

Type species: *Ponera sennaarensis* Mayr.

1. *Brachyponera chinensis* Emery, 1894 왕침개미

Brachyponera chinensis Emery, 1894, p. 460; Kim, 1970, p. 471; Collingwood, 1976, p. 300; Terayama et al., 1992, p. 23; Kim et al., 1993, p. 119 ; Kim et al., 1994, p.294.

Euponera (*Brachyponera*) *solitaria* Smith, 1874, p. 404.

Ponera nigrata chinensis Emery, 1894, p.360.

Locality. Ssanggye temple.

Distribution. Korea, China, Japan, and New Zealand.

Genus 2. *Ectomomyrmex* Mayr, 1867 일본침개미속

Ectomomyrmex Mayr, 1867, p. 83.

Type species. ?

2. *Ectomomyrmex javanus* Mayr, 1867 일본침개미

Ectomomyrmex javanus Mayr, 1867, p. 84; Kim, 1970, p. 472; Terayama et al., 1992, p. 23; Kim et al., 1993, p. 119; Kim et al., 1994, p. 295.

Pachycondyla (Ectomomyrmex) japonica Emery, 1902.

Pachycondyla japonicus: Wheeler, 1928.

Locality. Ssanggye temple.

Distribution. Korea, China, Japan, Taiwan, Sumatra, Java, Borneo, and Indochina.

Subfamily Cerapachinae 배잘록침개미아과

Genus 3. *Cerapachys* Fr. Smith, 1857 배잘록침개미속

Cherapachys Fr. Smith, 1858, p. 74.

Type species. *Cerapachys antennatus* Smith, 1858.

3. *Cerapachys humicola* Ogata 1983 배잘록침개미

Cherapachys humicola Ogata, 1985; Terayama et al., 1992, p. 24.

Locality. Hyangdong.

Distribution. Korea and Japan.

Subfamily Myrmicinae Lepeletier, 1836 두마디개미아과

Key to Genera of Myrmicinae

1. Post petiole attached to dorsum of first abdominal segment *Crematogaster*
- Post petiole attached to anterior face of first segment 2
2. Clypeus protruded like a tomb from anterior area of antennal base *Pristomyrmex*
- Clypeus not protruded like a tomb 3
3. Antennae six segmented *Strumigenys*
- Antennae more than ten segmented 4
4. Clypeus with two vertical protruded lines. Head and thorax with concave areas but without rugosities 5
- Clypeus with one vertical protruded line or rugosities 6
5. Antennae ten segmented and club two segmented *Solenopsis*
- Antennae twelve segmented and club three segmented *Tetramorium*
6. Antennal club three segmented and as long as sum of other segments or longer than it *Pheidole*
- Antennal club five segmented and shorter than sum of other segments *Aphaenogaster*

Genus 4. *Aphaenogaster* Mayr, 1853 황개미불이속

Aphaenogaster Mayr, 1853, p. 107.

Type species. *Aphaenogaster sarous* Mayr, 1903.

4. *Aphaenogaster famelica* (Smith, 1874) 황장다리개미

Ichnomymex famelicus Smith, 1874, p. 405.

Stenamma (Aphaenogaster) famelicum: Wheeler, 1906.

Aphaenogaster famelica: Mayr, 1878, p. 669.

Aphaenogaster ruida: Collingwood, 1976, p. 302.

Aphaenogaster famelica: Kim, 1970, p. 475; Collingwood, 1981, p. 26; Kim and Kim, 1982, p. 104; Kim and Kim, 1983, p. 72; Terayama et al., 1992, p. 26; Kim et al., 1993, p. 122; Kim et al., 1994, p. 296.

Locality. Ch'osang, Hyangdong, Jöpdo.

Distribution. Korea and Japan.

Genus 5. *Crematogaster* Lund, 1831 꼬리치레개미속

Crematogaster Lund, 1831, p. 132.

Type species. *Formica scutellaris* Oliver, 1791.

5. *Crematogaster brunnea teranishii* Santschi, 1930 검정꼬리치레개미

Crematogaster brunnea teranishii Santschi, 1930, p. 265; Terayama et al., 1992, p. 31; Kim et al., 1993, p. 122.

Locality. Ssanggye temple.

Distribution. Korea and Japan.

6. *Crematogaster osakensis* Forel, 1900 노랑꼬리치레개미

Crematogaster osakensis Forel, 1900, p. 369.

Crematogaster sordidula var. *japonica* Forel, 1912.

Crematogaster osakensis: Teranish, 1940, p. 4; Kim, 1963, p. 102; Kim, 1970, p. 478; Collingwood, 1976, p. 303; Terayama et al., 1992, p. 31; Kim et al., 1993, p. 122; Kim et al., 1994, p. 297.

Crematogaster sordidula osakensis: Kim and Kim, 1982, p. 4; Kim and Kim, 1983, p. 10, 11.

Locality. Jöpdo.

Distribution. Korea, China, and Japan.

Genus 6. *Monomorium* Mayr, 1855 집개미속

Monomorium Mayr, 1855, p. 452.

Type species. *Monomorium mimutum* Mayr, 1855.

7. *Monomorium chinense* Santschi, 1925 중국집개미

Monomorium minutum var. *chinense* Santschi, 1925, p. 86.

Monomorium chinense: Bolton, 1989; Terayama et al., 1992, p. 29; Kim et al., 1993, p. 123; Kim et al., 1994, p. 298.

Locality. Paengmok, Geumkap, Ch'öngryong.

Distribution. Korea, China, and Japan.

Genus 7. *Pheidole* Westwood, 1841 혹개미속

Pheidole Westwood, 1841, p. 87.

Type species. *Atta providens* Sykes, 1835.

8. *Pheidole fervida* Fr. Smith, 1874 극동혹개미

Pheidole fervida Fr. Smith, 1874, p. 406.

Pheidole fervida var. *kawazna* Teranishi, 1940.

Distribution. Korea, Japan, and Europe.

DISCUSSION

In all, 21 species were collected in this area, out of 109 species which have been recorded in Korea to date. Therefore it can be said that 19% of the ants from Korea are found on this island.

Table 1 shows the ant species collected from 11 sites of this area. Figures 1 and 2 show the relationships between collected sites and number of species. The most productive sites for sampling were Ssanggye temple, where 9 species were collected; the collecting rate was 43% ($9/21 \times 100$), conversely, Geumgap, Jönsöll, and Namsöll were the least productive, where just 2, 3, and 3 species, respectively, were found; the collecting rates were 9.5%, 14.3%, 14.3% ($2/21, 3/21, 3/21$) respectively (Table 1, Figs. 1 and 2).

The dominant species found were *Paratrechina sakure* (9 sites, 82%, $9/11 \times 100$) and *Pristomyrmex pungens* (8 sites, 73%, $8/11 \times 100$) which were present in 9 and 8 sites. The most rare species were *Brachiponera chinensis*, *Ectomomyrmex javanus*, *Cerapachys humicola*, *Camponotus jejuensis*, *Solenopsis japonica*, *Strumigenys lewisi*, *Lasius meridionalis*, *Formica fusca*, and *Formica japonica*, which were found in only 1 site, each collection rate of 9% ($1/11 \times 100$).

Unexpectedly *Formica japonica* was collected in only 2 sites and its collection rate was 18% ($2/11 \times 100$), despite that species' dominance in inland sites. Examining all data of this research, no endemic species are found, although the ant fauna of Chindo Island are quite different from that of inland or of other islands, as shown in Figures 1 and 2.

요 약

진도는 해남에서 약 40 km 정도 떨어져 있는 상당히 큰 섬으로서 많은 산과 하천이 있고 내륙지역에는 주로 농경지가 많은 특유한 섬이다. 또한 이 지역은 섬이긴 하지만 물사정이 좋아서 동식물들이 서식하기 좋은 지역이다. 저자들은 1994년 7월부터 10월까지 진도지역의 개미류를 채집하여 동정한 결과 4아과 15속 21종이 동정되어 보고한다.
