Abstract Ten species and three subspecies of the ant genus Pheidologeton Mayr are treated in the paper. One of them is described as new to science, i. e. P. zengchengensis sp. nov. A key based on major worker caste to the known Chinese species of the genus is presented.

Key words Hymenoptera, Formicidae, Pheidologeton, taxonomy, China.

The ant genus Pheidologeton, was established by Mayr in 1862 based on the type species Oecodoma diversa Jerdon ( = Pheidologeton diversus (Jerdon)). The genus consists of 27 species, 16 subspecies and 2 fossil species in the world (Bolton, 1995), most species distributed in the Indo-Australian, Oriental and Afrotropical regions. The first Chinese species of the genus, P. vespillo, was described by Wheeler in 1921, then in 1930 he reported 3 species and 3 subspecies, i. e. P. affinis, P. diversus, P. vespillo, P. diversus subsp. draco, P. diversus subsp. fictus, and P. diversus subsp. laotinus. Chou and Terayama recorded 4 species and 1 subspecies in Taiwan, added 2 species, i. e. P. dentiviris and P. yanoi, to Chinese ant fauna except the species and subspecies known in the mainland. While the species P. dentiviris was doubtful because it was described by Forel on the male only in 1913. Emery suggested that P. dentiviris was probably the male of P. yanoi, Wheeler suggested that it did not even belong to the genus Pheidologeton. Li and Tang described a species P. nanningensis from Guangxi in 1986. Zhou and Zheng studied the genus in Guangxi and described 3 species, i. e. P. melasolenus, P. latinodus and P. trechideros in 1997. When we studied the ants deposited in the Insect Collection of Zhongshan University, a new species was found. Ten species and three subspecies are recorded in China up to date. A key based on major worker caste to the known Chinese species and subspecies of the genus is given except for an uncertain species, P. dentiviris Forel.

The measurements and indices used in the paper are as defined by Bolton (1995): TL (Total Length),

HL (Head Length), HW (Head Width), CI (Cephalic Index = HW × 100/ HL), SL (Scape Length), SI (Scape Index = SL × 100/ HW), PW (Pronotal Width), AL (Alitrunk Length). All measurements are expressed in mm.

Key to the known species of the genus Pheidologeton Mayr in China (Based on major worker caste)

- The maximum workers with their total length 10 to 11 mm .......

  P. diversus subsp. fictus Forel
  The maximum workers with their total length more than 14 mm ...

Distribution. China (Guangxi).

12 Pheidologeton trechideros Zhou et Zheng Pheidologeton trechideros Zhou et Zheng, 1997: 167.

Distribution. China (Guangxi, Jiangxi).

13 Pheidologeton zengchengensis sp. nov. (Figs. 1-2)

Holotype major worker. TL 12.8, HL 3.52, HW 3.43, CI 97, SL 1.28, SI 37, PW 1.71, PNL 0.88, PNH 0.88, PNW 0.78, PPL 0.59, PPH 0.80, PPW 1.03, ED 0.41.

Head slightly longer than broad, as broad in front as in the post, the sides slightly convex. Occipital margin widely emarginated, a deeply impressed narrow groove present down to the front. Mandible Major, masticatory margin without tooth in large worker, with two strong blunt apical teeth and two broad shorter basal teeth in the medium worker. Clypeus narrow, anterior border broadly sinuate. Antennal carinae short, divergent. Antennae slender. Eyes moderately large, placed at anterior 2/5 of the side of the head. Promesonotum convex, promesonotal suture lightly impressed. Mesoscutellum prominent, metanotum distinct. Dorsum of propodeum slightly shorter than the declivity, and the declivity longitudinally concave in the middle. Propodeal spines thick at base, acute at tip, less than 1/3 length of the distance between the base of the two spines, directed backward and slightly outward. Petiole rather short, petiolar node thick and subtriangular in profile, upper margin slightly convex in the middle. Postpetiolar node transverse in dorsal view, as broad as petiolar node in major worker or twice as broad as the petiolar node in the medium worker.

Head longitudinally striate anteriorly. Mandibles smooth and shinning. Occipital lobes of head,

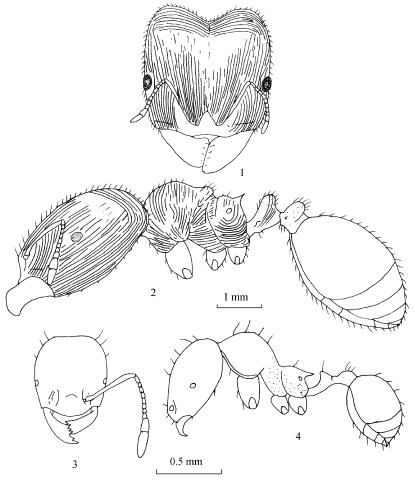

pronotum, dorsum of propodeum, and petiolar node transversely striate. Spaces between striation smooth. Postpetiolar node and gaster smooth and shining. Erect hairs abundant on the whole body. Color dark brownish red. Mandibles and gaster blackish red. Antennae and legs paler.

Paratype 14 media workers. HL 1.30-2.80, HW 1.25-2.70, SL 0.65-1.08, CI 96, SI 40-52, PW 0.60-1.35, PNH 0.66, PNL 0.68, PNW 0.56, PPH 0.60, PPL 0.25-0.66, PPW 0.29-0.83, ED 0.31, TL 4.6-9.9. Occipital less concave, scutellum less prominent. Other characters are the same as the major worker. 7 minor workers. HL 0.50-0.60, HW 0.50-0.60, SL 0.30-0.50, SI 60-83, CI 98-100, PW 0.35-0.40, AL 0.60-0.75, ED 0.05-0.06. Occipital straight to feebly concave. Masticatory margin of mandible with five teeth. Antennal scapes short, close to occipital border. Mandible longitudinally striate.

Head, pronotum and gaster smooth and shinning, mesopleurae and propodeum shagreened. Erect hair long and sparse. Color brown. Propodeum and peticel paler.

Holotype major worker, Taibai Slope, Zengcheng, Guangdong Province, South of China, 26 Sep. 1984, ZHANG Zhu-Xu leg. Paratype 14 media workers and 7 minor workers, Taihe Ancient Cave, Qingxin County, Guangdong Province, South of China, 25 Aug. 2005, ZHAO Shuang leg.

This new species resembles P. trechideros Zhou et Zheng, but the major worker differs from the later in mandibles smooth and shining, spaces between striation smooth, propodeal spine thick and straight, not curved forward. The minor worker differs from the later in promesonotum much higher, propodeal spine longer, not curved upward.

Figs. 1-4. Pheidologeton zengchengensis sp. nov. 1-2. Major worker. 3-4. Minor worker. 1, 3. Head in full-face view. 2, 4. Body in profile view.

摘要 记述中国巨首蚁属 Pheidologeton 10 种和 3 亚种,其中 1 新种即增城巨首蚁 P. zengchengensis sp. nov.。新种与粗纹巨首蚁 P. trechideros Zhou et Zheng 相似,但大型工蚁与后者的区别是上颚光亮无刻纹,体刻纹间面光亮无刻点,并胸腹节刺圆而直,不向前弯曲。新种的小型工蚁与粗纹巨首蚁

的区别是前-中胸背板凸远高于后者,并胸腹节刺直,不向上弯。文中提供了中国已知 9 种 3 亚种的分种检索表,另一种齿突巨首蚁 P. dentiviris Forel 因仅依据雄蚁描述而且分类地位不定,未包括在检索表中。
